

ABSTRACT OF THE DISCLOSURE

A fluid dispenser with a replaceable receptacle containing fluid positioned within a housing. An inlet tube and an outlet tube are connected to a pump for drawing fluid from the receptacle and moving the fluid through a nozzle having an outlet aperture. The nozzle is secured to a hand actuatable cover which is depressable to operate the pump. The pump is mounted upon a retainer structure which is connectable to the housing. When the receptacle becomes empty, the retainer may be disengaged from the housing, and the retainer and pump are then lifted away as one unit from the housing. The empty receptacle may then be replaced with a full one, and in reverse order, the dispenser may be reassembled.
